

Amend the abstract as follows:

ABSTRACT OF THE DISCLOSURE

Two or more different materials such as food material are co-extruded through adjacent orifices of an extruder. The flows of the two materials are cut in a direction transverse to the flow to form segments of flow. These segments are interspersed so as to join upstream and downstream of each segment of first material to a segment of a second material. Generally two rows of joined segmented flows are extruded side by side. Preferably between the ~~two~~ two rows is formed a boundary cell wall which usually is transformed to a harder material after extrusion. Cell walls of the harder material may surround, in two or three dimensions, cells of softer ~~ef~~ or foamed material. The apparatus and method to provide the food product having the cell-like structure is particularly useful for producing confectionery products formed of chocolate, marzipan or dough materials.
